

Publications Update

MARK 386S Business System Installation/Operation Guide

**Incorporation of the attached pages
into Revision B of the manual
brings it up to Revision C**

May 1991

Publications Update

TO: MARK 386S Users
FROM: Publications Department
DATE: May 22, 1991
**SUBJ: MARK 386S Business System Installation/Operation Guide,
REVISION C UPDATE PACKAGE**

The MARK 386S Installation/Operation Guide has been updated. The revised pages are attached. Incorporation of these pages into a Rev B document brings it up to Revision C. Remove and insert pages as indicated below.

NOTICE

Every effort has been made to make this manual complete, accurate and up-to-date. However, all information herein is subject to change due to updates. All inquiries concerning this manual should be directed to POINT 4 Data Corporation.

WARNING!

This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause interference to radio communications. As temporarily permitted by regulation it has been tested for compliance with the limits for Class A computing devices pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

Section 4

INSTALLING DOS ON THE HARD DISK DRIVE

4.1 GENERAL

This section provides the user with the information or references necessary to initially load the Disk Operating System (DOS), low-level format the hard disk, partition it with **fdisk**, format it for DOS, and finally install DOS.

Many versions of DOS are available. While the general steps given in this section will be applicable to all versions of DOS, specific steps are given for Microsoft MS-DOS Operating System Version 3.3.

Additional information can be found in the *MS-DOS User's Guide and User's Reference* manuals, or in the manuals provided with your particular operating system.

Section 5 provides information on installing XENIX on the hard disk.

4.2 CONFIGURING THE HARD DISK

To enable MS-DOS to boot automatically when you turn on your computer, you must load the MS-DOS files onto your hard disk. First, you must configure your hard disk to accept MS-DOS, since it was only low-level formatted at the factory. The following subsections contain the procedures necessary to configure the hard disk; they include:

1. Low-level format the disk (done at the factory).
2. Partition the disk using the **fdisk** command.
3. Format the disk for MS-DOS.
4. Install MS-DOS.

4.2.1 Low-Level Formatting

The hard disk drive installed in your system was low-level formatted before it left the factory. Low-level formatting is only required for newly installed, unformatted drives or drives which have experienced a catastrophic failure.

CAUTION

Low-level formatting will result in the loss of all data stored on the hard disk drive. Back up the data (if applicable) before beginning this procedure.

The following is a step-by-step procedure to perform the low-level formatting.

1. Get into the System Set-Up by using <CTRL>, <ALT>, and <Insert>. For each hard disk drive connected to the controller, specify "Type 1". For each hard disk drive not connected to the controller, specify "not installed".
2. Boot DOS 3.3 or higher revision from the floppy disk drive. The computer may display a hard disk error message. This is because the hard disk has not been formatted yet. Load the DEBUG program. To do this from the DOS prompt ">", enter:

```
DEBUG <RETURN>
```

Once in the DEBUG program, the prompt is changed to "-". Enter:

```
G=C800:5 <RETURN>
```

The format menu is displayed.

3. Upon entrance into the BIOS format program, the following message is displayed. Select "0" for AUTO-SETUP. AUTO-SETUP will generate the drive parameters by reading them from the ESDI disk drive.

```
DO YOU WANT AUTO-SETUP OR ROM-BASED TABLE SETUP?  
(0=AUTO-SETUP, 1=ROM-BASED TABLE) : 0
```

4. The following is then displayed:

```
HOW MANY DRIVES DO YOU HAVE? (0, 1 OR 2) : 1
```

Enter the number of hard disks attached to the system, then press the <RETURN> key.

5. The Main Menu is displayed on the screen:

```
NCL 5355/5356 ESDI DISK FORMAT UTILITY PROGRAM (V4.X)

DRIVE 0 PARAMETERS: HEAD=XX,CYLINDER=XXXX,SECTOR/TRACK=XX
-----
DRIVE 0 TRANSLATION NOT ACTIVE      TRUNCATION NOT ACTIVE

0-FORMAT DRIVE
1-VERIFY
2-ENABLE TRANSLATION MODE
3-DISABLE TRANSLATION MODE
4-ENABLE CYLINDER TRUNCATION
5-DISABLE CYLINDER TRUNCATION
6-EXIT

PLEASE ENTER YOUR CHOICE
```

The drive parameter displayed on the second line is the physical drive parameter acquired from the attached ESDI disk drive. If two drives are connected to the controller card, the additional drive parameter information will be displayed on the screen.

6. Format the drive by selecting "0" from the option. By selecting this option, the controller initializes the disk drive according to the drive parameter displayed on the second line of the main menu. The BIOS prompts the choice of drive "0" or "1" to be formatted.

```
WHICH DRIVE DO YOU CHOOSE? (0/1): 0

WARNING: ALL FILES ON DISK DRIVE WILL BE LOST!!!
DO YOU WISH TO CONTINUE? (Y/N): N
```

The BIOS asks the confirmation of loss of files. Answer "Y" to continue. After the completion of initialization, the following question is asked:

```
FOR DEFECT HANDLING:
DO YOU WANT SECTOR MAPPING OR TRACK MAPPING?
(0=SECTOR_MAPPING, 1=TRACK_MAPPING):0
```

Answer "0" selecting Sector Mapping for the defect handling.

DO YOU WANT TO USE MANUFACTURERS DEFECT LIST? (Y/N) : Y
PRESS ANY KEY TO DISPLAY MANUFACTURERS DEFECT LIST.

DEFECT LIST

PRESS ANY KEY TO START FORMATTING THE DEFECT LIST, IF ANY.

Answering "Y" to the question makes the controller read the defect list from the drive and perform the defect map.

If you see the following message displayed, use the manual defect entry for the particular surface by answering "Y" to additional defect entry in Step 7.

CAN NOT READ MANUFACTURERS DEFECT LIST FOR SURFACE: XX

7. After performing Step 6, the BIOS prompts for the additional defect information as shown below.

DO YOU WANT TO ENTER ADDITIONAL DEFECTS? (Y/N) : N

By answering "Y" to this question, the following Cylinder and Head information will be requested. Answering "N" to this question brings you back to the main menu.

ENTER CYLINDER NUMBER: XXXX

ENTER HEAD NUMBER: YY

ENTER BYTE COUNT FROM INDEX: ZZZZ

ARE THE CYLINDER AND HEAD NUMBERS ABOVE CORRECT? (Y/N) : Y

MORE BAD TRACK TO ENTER? (Y/N) :

Each time the entry is confirmed, the controller performs bad sector format. Answering "N" returns to the main menu.

8. The controller BIOS provides disk surface verify function to detect additional defects. If a bad spot is detected during the verify operation, bad track format is performed automatically. If there are no more defects before the verify operation, you can skip this operation.

After performing the verification, the BIOS will return to the main menu. This verify process will destroy the data on the disk drive.

9. After preparation is complete, select "EXIT" from the main menu.

PUSH CTRL, ALT, DEL TO REBOOT THE SYSTEM

THEN USE "FDISK" AND "FORMAT" UTILITIES
TO COMPLETE HARD DISK INSTALLATION PROCESS

After rebooting the system, you are ready to install the operating system to the attached ESDI disk drive.

Notes:

1. The disk drives should be set to enable Spin-Up when power is applied.
2. See Appendix F for jumper settings for the MAXTOR 8760E disk drive.

4.2.2 Partitioning the Hard Disk

A hard disk can be partitioned, or divided, into a maximum of four independent sections, each containing the same or different operating systems. Before your hard disk can use MS-DOS, an MS-DOS partition must be created on it. Many users create a single partition and use the entire hard disk for MS-DOS. If you plan to create partitions for both MS-DOS and XENIX, the MS-DOS partition must be created first.

Run **fdisk** and try to create an MS-DOS partition. If an MS-DOS partition exists, a message to that effect will be displayed.

Refer to the *MS-DOS User's Reference*, Appendix F or the manual provided with your operating system for the hard disk partitioning procedure.

4.2.3 Formatting the Hard Disk and Installing MS-DOS

After you have low-level formatted and partitioned the hard disk for MS-DOS, you must format it so that it can accept MS-DOS. The following procedures assume your hard disk is designated as drive C.

Format Procedure:

1. Manually boot MS-DOS and enter the current date and time.

At the A> prompt type:

```
format c: /v /s <RETURN>
```

where: /v allows the user to assign a name to the volume of data in drive C, and /s adds the system files to drive C making it self-booting.

MS-DOS will now format the hard disk.

2. When the format process is complete, a message similar to the following is displayed:

```
Volume label (11 characters, ENTER for none) ?
```

Enter the name you wish to use to identify the volume of data in drive C and press <RETURN>, or just press <RETURN> if you do not wish to choose a name at this time.

MS-DOS then asks:

```
Format another? (Y/N)
```

Type "N" to stop the format process.

NOTICE

Every effort has been made to make this manual complete, accurate and up-to-date. However, all information herein is subject to change due to updates. All inquiries concerning this manual should be directed to POINT 4 Data Corporation.

WARNING!

This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause interference to radio communications. As temporarily permitted by regulation it has been tested for compliance with the limits for Class A computing devices pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

2.7 INSTALLING THE 8-PORT SERIAL CONTROLLER

Instructions for installing the 8-port Serial Controller are contained in the *8-Port Serial Controller User Guide*, dated November 1988 (Order Number HTP0076).

Using the Arnet driver, XENIX supports a maximum of two 8-port controllers, one as COM1 and the other as COM2. XENIX does not support chaining two or more boards on one interrupt.

2.7.1 Installing the 8-Port Serial Controller as COM1

1. JP1 must have a jumper across location 3.
2. JP2 must have a jumper across location 3 (IRQ4).
3. Set SW1, keys 1 through 4, to 1 0 1 1, where 1=ON or Closed (Address 100H).
4. Set SW2, keys 1 through 8 to 1 0 1 0 1 1 0 0.
5. On the 1P/2S Adapter change Port 1 to use COM3 instead of COM1 (see Table 2-8).
6. Run **mkdev serial** to install an 8-port card on COM1.

2.7.2 Installing a Second 8-Port Serial Controller as COM2

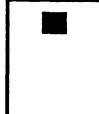

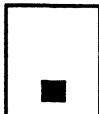

1. JP1 must have a jumper across location 3.
2. JP2 must have a jumper across location 2 (IRQ3).
3. Set SW1, keys 1 through 4, to 1 0 0 1, where 1=ON or Closed (Address 180H).
4. Set SW2, keys 1 through 8, to 1 0 0 0 1 1 0 0.
5. On the 1P/2S Adapter change Port 2 to use COM4 instead of COM2 (see Table 2-8).
6. Run **mkdev serial** to install an 8-port card on COM2.

2.8 INSTALLING THE ATI VIDEO ADAPTER

There are four switches in one assembly on the rear of the card.

Switch 1 (SW1) is used to select the mode of operation which will be in effect at power-on (see Table 2-4).

Table 2-4. Video Mode Select

Default Mode	Graphics Solution SW1 Switch Settings
Color/Graphics	 1 OFF/Closed ON/Open
Monochrome/Graphics	 1 OFF/Closed ON/Open
Color/Graphics – Selects for IBM Color/Graphics, Plantronics Color/Graphics and ATI 640 x 200 16 Color/Graphic modes.	
Monochrome/Graphics – Selects for Monochrome Text Mode (MDA), and Hercules Monochrome/Graphics Mode.	

Switches 2 and 3 are used to identify the type of monitor that is being used (see Table 2-5).
