SCZ-6 Compatibility with CSS disk Drives

#30
12/21/92

Situation: The SCZ-6 has been successfully integrated with Data General's CSS disk drives. Below are a list of guidelines to aid with the integration.

Guidelines:

- 1) Ensure the CSS specific internal cable (350-0067-00) is installed when operating the CSS disk enclosure. If a Zetaco enclosure is to be daisy-chained to the CSS enclosure, a modified external cable must be used. The standard external cable will not operate the add-on enclosure when daisy-chained to a CSS enclosure. Contact Zetaco for more cabling information.
- 2) When the SCZ-6 is configured for CSS compatibility, controller soft error logging is disabled. This is required to remain CSS compatible. This is not a problem since most SCSI disk drives support auto relocation. When adding disk drives, configure the SCZ-6 ensuring auto relocation is enabled. The SCZ-6 will operate the CSS drives as the CSS controller ran them; disk drive auto relocation will not be changed from how the CSS controller operated the CSS disk drives.
